

Fusing Equipment

ELSP Current-Limiting Backup Fuse

Electrical Apparatus

240-98

GENERAL

The Cooper Power Systems ELSP Current-limiting Backup Fuse is used in series with low current primary protection devices such as a Bay-O-Net Fuse or MagneX™ Interrupter.

The ELSP fuse is designed for use in transformer oil, Envirotemp™ FR3™ fluid, or an approved equivalent.

The fuse's highly efficient current-limiting section minimizes the effects of high fault current stresses on equipment and the distribution system. Its minimum interrupting rating is coordinated with that of a low current interrupter to avoid undesirable low current operation; yet its maximum interrupting rating will clear the highest fault currents likely to occur. Higher continuous current ratings can be achieved by connecting two fuses in parallel.

APPLICATION

The ELSP fuse is used in transformers to protect and isolate faulted equipment. When connected in series with a low current primary protection device, the fuse becomes an element of a two-part protection system that gives a full range of fault protection.

This two-part system provides low current protection with the replaceable expulsion fuse or resettable MagneX Interrupter, and it adds the energy-limiting protection of a current-limiting fuse. Together, they coordinate easily with upstream and downstream devices.

Figure 1.
ELSP Current-Limiting Backup Fuse.

INSTALLATION

No special tools are required. The fuse is liquid immersed, mounted as near as possible to the incoming primary bushing to which it is connected. Normal liquid dielectric clearances should be used. Refer to Installation Instructions Sheet S240-50-1 for details.

PRODUCTION TESTS

Tests are conducted on 100 percent of production in accordance with Cooper Power Systems requirements.

- Physical Inspection
- I^2t Testing
- Resistance Testing
- Helium Mass Spectrometer Leak Testing

TABLE 1
Electrical Ratings and Characteristics

Fuse Type	Maximum Interrupting Current
8.3 kV - 15.5 kV Backup "C" Rated	50,000 A rms symmetrical
17.2 kV Backup "C" Rated	43,000 A rms symmetrical
23 kV Backup "C" Rated	31,000 A rms symmetrical*

* 23 kV, 150 A fuse is rated to 50,000 A rms symmetrical

Notes:

- The 8.3 kV, 80 A and 100 A ratings have been tested and approved for application at 9.9 kV.
- The 15.5 kV, 80 A through 125 A ratings have been tested and approved for application at 17.2 kV.
The maximum interrupting rating for the 15.5 kV fuse, 80 A through 125 A at 17.2 kV is 43 kA. For the 23 kV, 250 A fuse (parallel 125 A) the maximum interrupting rating is 12 kA.

** Parallel Fuses

ORDERING INFORMATION

To order an ELSP current-limiting fuse, determine the amperage and voltage ratings of the application and specify the fuse required from Table 3. For parallel fusing, order two fuses.

Method A

CORRELATION INFORMATION

Use the correlation information in Tables 4, 5 and 6 to determine the amperage and voltage ratings of the ELSP fuse combination required for the application. Then use Table 3 to determine the appropriate ELSP fuse catalog number.

Correlation is based on IEEE Std C57.92™ standard Loading Guide and IEEE Std C57.109™ standard Through-Fault Guide, and the Pad-mounted Transformer Fusing Philosophy Reference Document, R240-000-1.

Tables 4, 5 and 6 indicate the recommended Bay-O-Net fuse link or MagneX Interrupter and ELSP combination for each application.

To order a Current Sensing Bay-O-Net Fuse, complete catalog number 4000353____.

To order a Dual Sensing Bay-O-Net Fuse, complete catalog number 4000358____.

To order a Dual Element Bay-O-Net Fuse, complete catalog number 4038108____.

To order a High Ampere Overload Bay-O-Net Fuse Link, complete catalog number 4038361____.

Examples:

To order an ELSP and Dual Element Bay-O-Net fuse combination for a single-phase, 7.2 kV phase-to-ground, 50 kVA transformer, specify:

1-50 A ELSP Fuse CBUC08050C100

1-Bay-O-Net Fuse 4038108C07

Method B

TIME CURRENT CURVES

To determine or confirm the ELSP fuse that will coordinate with upstream and downstream system requirements, use the time-current characteristic curves and specify the fuse indicated from Table 3.

For full size TCC curves R240-91-167 (8.3/9.9 kV), R240-91-168 (15.5/17.2 kV), and R240-91-169 (23.0 kV), contact your Cooper Power Systems representative.

 Indicates parallel fuse application

Notes:

The following tables show minimum recommended ELSP fuse ratings. Recommended ELSP backup fuse will coordinate with protecting fuse and melt only on internal transformer faults. Recommended Bay-O-Net fuses meet inrush criterion of 12 times transformer full load current for 0.1 second. If a different transformer impedance is used, a different ELSP Fuse rating may be required. If a larger % Z is used, a smaller ELSP may coordinate.

a. Current Sensing Bay-O-Net fuse is selected to melt at 3 to 4 times transformer full load in 300 seconds.

b. Dual Sensing and Dual Element Bay-O-Net fuses are selected to limit transformer load to approximately 160% for 7 hours and 200% for 2 hours with the transformer initially carrying 75% of rated load at ambient temperature of 35 °C.

c. The use of these fuses will provide 175% of rated load for 2 hours and 150% of rated load for 7 hours. Contact your Cooper Power Systems representative for specific overload capability.

 Indicates parallel fuse application

Notes:

- The following tables show minimum recommended ELSP fuse ratings. Recommended ELSP backup fuse will coordinate with protecting fuse and melt only on internal transformer faults. Recommended Bay-O-Net fuses meet inrush criterion of 12 times transformer full load current for 0.1 second. If a different transformer impedance is used, a different ELSP Fuse rating may be required. If a larger % Z is used, a smaller ELSP may coordinate.
- a. Current Sensing Bay-O-Net fuse is selected to melt at 3 to 4 times transformer full load in 300 seconds.
 - b. Dual Sensing and Dual Element Bay-O-Net fuses are selected to limit transformer load to approximately 160% for 7 hours and 200% for 2 hours with the transformer initially carrying 75% of rated load at ambient temperature of 35 °C.
 - c. The use of these fuses will provide 175% of rated load for 2 hours and 150% of rated load for 7 hours. Contact your Cooper Power Systems representative for specific overload capability.
 - d. Use 23.0 kV Rated ELSP fuse for this application range. (See Table 2, Note 2, Page 3 of this catalog section.)

 Indicates parallel fuse application

Notes: Table shows minimum recommended ELSP fuse rating. Recommended ELSP backup fuse will coordinate with protecting fuse and melt only on internal transformer faults. Recommended Bay-O-Net fuses meet inrush criterion of 12 times transformer full load current for 0.1 second.

The Bay-O-Net fuse cannot be used on grounded wye-grounded wye transformers above 23 kV if there is more than a 50% delta load. If that is the case, the recovery voltage on the fuse can exceed the 23 kV rating of the Bay-O-Net fuse.

- a. Current Sensing Bay-O-Net fuse is selected to melt at 3 to 4 times transformer full load in 300 seconds.
- b. Dual Sensing and Dual Element Bay-O-Net fuses are selected to limit transformer load to approximately 160% for 7 hours and 200% for 2 hours with the transformer initially carrying 75% of rated load at ambient temperature of 35 °C.
- c. The use of these fuses will provide 175% of rated load for 2 hours and 150% of rated load for 7 hours. Contact your Cooper Power Systems representative for specific overload capability.
- d. The use of these fuses will provide slightly less than 175% of rated load for 2 hours and 150% of rated load for 7 hours. Contact your Cooper Power Systems Representative for specific overload capability.

 Indicates parallel fuse application

Notes: Table shows minimum recommended ELSP fuse rating. Recommended ELSP backup fuse will coordinate with protecting fuse and melt only on internal transformer faults. Recommended Bay-O-Net fuses meet inrush criterion of 12 times transformer full load current for 0.1 second.

The Bay-O-Net fuse cannot be used on grounded wye-grounded wye transformers above 23 kV if there is more than a 50% delta load. If that is the case, the recovery voltage on the fuse can exceed the 23 kV rating of the Bay-O-Net fuse.

- a. Current Sensing Bay-O-Net fuse is selected to melt at 3 to 4 times transformer full load in 300 seconds.
- b. Dual Sensing and Dual Element Bay-O-Net fuses are selected to limit transformer load to approximately 160% for 7 hours and 200% for 2 hours with the transformer initially carrying 75% of rated load at ambient temperature of 35 °C.
- c. The use of these fuses will provide 175% of rated load for 2 hours and 150% of rated load for 7 hours. Contact your Cooper Power Systems representative for specific overload capability.

Notes: Recommended MagneX Primary Breakers will allow approximately 140% of rated load current for 4 hours, before operating, with the transformer carrying 75% of its rated current prior to the overload in 35 °C ambient temperature around the transformer.

Recommended Bay-O-Net Links are shown in the table.

Recommended ELSP Back-up fuse links will operate only on faults within the transformer; to maintain this coordination, if a smaller transformer % IZ is specified a larger ELSP may be needed; with a larger % IZ, a smaller ELSP may be usable.

Notes: Recommended MagneX Primary Breakers will allow approximately 140% of rated load current for 4 hours, before operating, with the transformer carrying 75% of its rated current prior to the overload in 35 °C ambient temperature around the transformer.

Recommended Bay-O-Net Links are shown in the table.

Recommended ELSP Back-up fuse links will operate only on faults within the transformer; to maintain this coordination, if a smaller transformer % IZ is specified a larger ELSP may be needed; with a larger % IZ, a smaller ELSP may be usable.

APPLICATION PEAK LET-THROUGH CURRENT

Maximum peak let-thru curves provide the opportunity of comparing an unprotected system of one protected with an expulsion fuse, boric acid fuse or recloser to a system protected with ELSP current-limiting backup fuse. For example, as shown in Figure 4,

an unprotected circuit with a 10,000 A available fault current can deliver a maximum peak current to a fault of about 28,000 A (find the intersection of the 10,000 A available current line with the peak current line, and read the result on the left maximum let-thru axis). This would be the current delivered, regardless of the size of any **expulsion** fuse that could be applied.

Protecting this apparatus with a 15.5 kV, 80 A, ELSP fuse however, would limit the peak let-thru current to the apparatus to about 8,000 A. This is the same peak let-thru delivered to a fault by a system having only 4800 A available current.

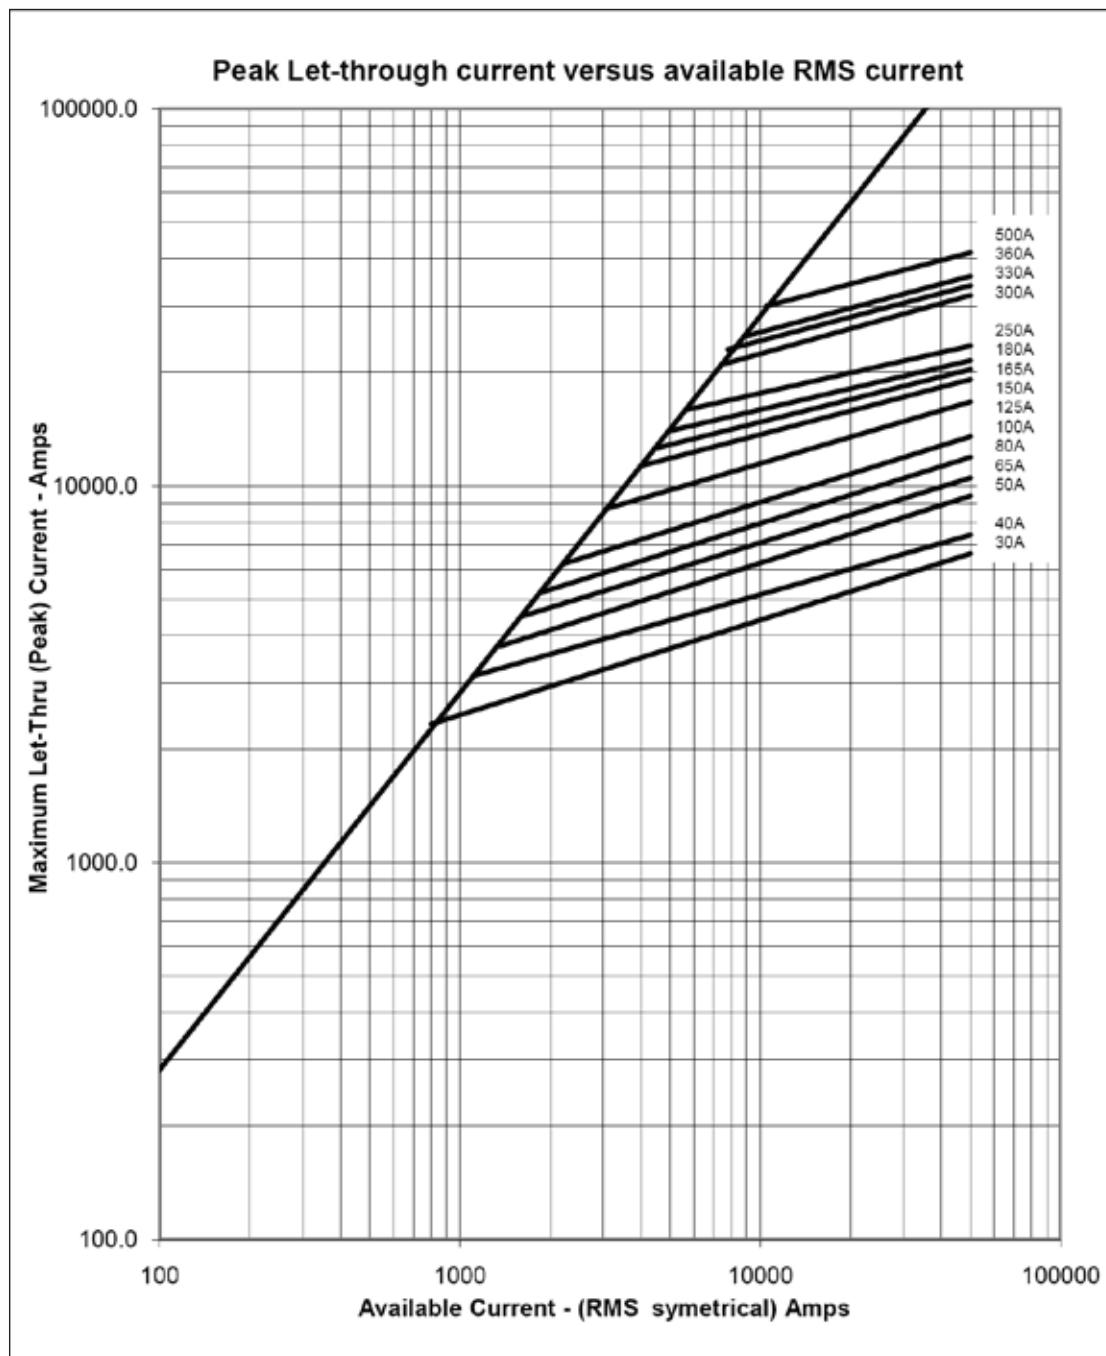

Figure 4.
Peak Let-through Curves for 8.3 kV, 9.9 kV, 15.5 kV, 17.2 kV and 23 kV ELSP Backup Current-Limiting Fuse.

TABLE 9

Notes:

The MagneX Interrupter recommendations are based on:

- Deration factor of 0.5% per °C above 25 °C.
- Allowable loading greater than 140% for four hours in accordance with IEEE Std C57.91™-1981 standard guide for Loading Distribution Transformers, Table 6.
- If using a MagneX Interrupter equipped without emergency overload, a smaller ELSP rating may be used.
- The Bay-O-Net fuse cannot be used on grounded wye-grounded wye transformers above 23 kV if there is more than a 50% delta load. If that is the case, the recovery voltage on the fuse can exceed the 23 kV rating of the Bay-O-Net fuse.
